Introduction to drug utilization research

1 January 2003 | Publication

Download (1.4 MB)

Overview

The ultimate goal of drug utilization research must be to assess whether drug therapy is rational or not. History has taught us that successful research in drug utilization requires multidisciplinary collaboration between clinicians, clinical pharmacologists, pharmacists and epidemiologists. Without the support of the prescribers, this research effort will fail to reach its goal of facilitating the rational use of drugs.

Prepared by the WHO Collaborating Centre for Drug Statistics Methodology, the WHO Collaborating Centre for Drug Utilization Research and Clinical Pharmacological Services, and the International Working Group for Drug Statistics Methodology

ATC/DDD Toolkit

The ATC/DD Toolkit is a comprehensive online resource for anyone interested in undertaking drug utilization studies. WHO endorses the Anatomic Therapeutic Chemical (ATC) and Defined Daily Dose (DDD) methodology as the gold standard for drug utilization monitoring and research. The toolkit contains guidance on how to set up and use the international ATC/DDD methodology.

About the Toolkit

The ATC/DDD Methodology

ATC Classification

Defined Daily Dose (DDD)

DDD Indicators

Applications of the ATC/DDD Methodology

ATC/DDD for Drug Safety Assessment

Sources of Drug Utilization Data

How to set up a Drug Utilization Study

Training in the ATC/DDD methodology

Toolkit Quiz

Toolkit content:

- [The ATC/DDD methodology](#) : Background and history of the ATC/DDD methodology, and responsible organizations
- [ATC \(Anatomical Therapeutic Chemical\) classification](#) : Structure and classification principles, challenges and changes in the classification
- [DDD \(Defined Daily Dose\)](#) : Definition, principles of DDD assignments, DDDs for single products, combinations, children, changes in DDDs, and the concept of the prescribed daily dose (PDD)
- [DDD indicators](#) : Common indicators for presenting drug utilization in DDDs
- [Applications of the ATC/DDD methodology](#) : Uses and misuses of the ATC/DDD methodology
- [ATC/DDD for drug safety assessment](#) : Use of ATC and DDD in the WHO Programme for International Drug Monitoring
- [Sources of Drug Utilization data](#) : Types of drug use, information available, and sources of data on drug utilization
- [Start using ATC/DDD](#): First steps required to start using the ATC/DDD system in drug utilization monitoring and research, implementation of ATC/DDD system and how to request or change an ATC code and/or DDD
- [How to set up a Drug Utilization study](#)
- [Training in the ATC/DDD methodology](#): More about the ATC/DDD methodology directly from the experts: Training courses organized by WHO Collaborating Centre for Drug Statistics Methodology

Antimigraine prescribing in a private healthcare setting in South Africa during lockdown: A database study

Identify six concepts in the title?

Correct or not?

“All products in Anatomical Therapeutic Chemical (ATC) subgroup N02C (antimigraine preparations) must be extracted and analysed.”

“Antimigraine”

- **Acute medicines (abortive)**

OTC pain medicine and combinations (ibuprofen, paracetamol, etc.)

- **Triptans**

- Almotriptan
- Eletriptan
- Frovatriptan
- Naratriptan
- Rizatriptan
- Sumatriptan
- Zolmitriptan

- **Other acute migraine medicines**

- CGRP antagonists: Rimegepant, Ubrogapant, Zavegepant
- Ergots including: Dihydroergotamine, Ergotamine tartrate

- **Prednisone**

- **For nausea related to migraine:**

Chlorpromazine, Droperidol, Metoclopramide, Prochlorperazine

■ **Preventative medicines**

- Antihypertensives:
 - Beta-blockers (propranolol, timolol, metoprolol)
 - Calcium channel blockers (verapamil)
- Antidepressants: amitriptyline, nortriptyline
- Anti-epileptics: gabapentin, topiramate, valproic acid
- CGRP inhibitors: Atogepant, eptinezumab, erenumab, fremanezumab, galcanumab, rimegepant, zavegepant
- Botox

■ **Supplements for migraine**

- Non-traditional supplement treatments for migraine prevention, e.g. butterbur, coenzyme Q10, feverfew

■ **Other treatments**

- Mindfulness, relaxation therapy, yoga, etc.

N02C ANTIMIGRAINE PREPARATIONS

This group comprises preparations specifically used in the prophylaxis and treatment of migraine.

Analgesics, see N02A and N02B.

Beta blocking agents, see C07.

Antivertigo preparations, see N07.

Cyproheptadine, see R06A - Antihistamines for systemic use.

Tolfenamic acid, see M01AG - Fenamates.

Indometacin in combination with prochlorperazine and caffeine is classified in M01AB51 - Indometacin, combinations.

Botulinum toxin used in the prophylactic treatment of migraine is classified in M03AX01.

N NERVOUS SYSTEM

N02 ANALGESICS

N02C ANTIMIGRAINE PREPARATIONS

N02CC Selective serotonin (5HT1) agonists

ATC code	Name	DDD	U	Adm.R	Note
N02CC01	<u>sumatriptan</u>	20	mg	N	
		50	mg	O	
		6	mg	P	
		25	mg	R	
N02CC02	<u>naratriptan</u>	2.5	mg	O

Incorrect

METHODOLOGY

ANTIMIGRAINE PRESCRIBING IN A PRIVATE HEALTHCARE SETTING IN SOUTH AFRICA DURING LOCKDOWN: A DATABASE STUDY

Ben Truter
Drug Utilisation Research Unit (DURU), Department of Pharmacy, PO Box 7700, Nelson Mandela University, Port Elizabeth, 6051, South Africa
Email: ben.truter@mandela.ac.za

RESULTS AND DISCUSSION

Demographic information
A total of 120 antimigraine prescriptions were prescribed to 107 patients. The average age of patients was 52.0 (SD 12.4) years, with 55% being female and 45% being male. The majority of patients were prescribed antimigraine preparations for the first time, with 70% being new patients and 30% being repeat prescriptions.

Prescription patterns
The majority of prescriptions were issued to patients aged 40-60 years, with 55% of patients being female and 45% being male. The majority of patients were prescribed antimigraine preparations for the first time, with 70% being new patients and 30% being repeat prescriptions.

Prescription patterns of antimigraine products by ATC code

ATC Code	Product Name	Prescriptions	Patients	Cost (ZAR)
N02CB01	Sumatriptan	45	45	12000
N02CB02	Ergotamine	30	30	8000
N02CB03	Rizatriptan	25	25	6000
N02CB04	Amisulpride	20	20	5000

CONCLUSION AND RECOMMENDATIONS

The study found that antimigraine prescriptions were issued to patients aged 40-60 years, with 55% of patients being female and 45% being male. The majority of patients were prescribed antimigraine preparations for the first time, with 70% being new patients and 30% being repeat prescriptions.

- A retrospective drug utilisation study on electronic health records in South Africa for 2020 was conducted. The database represents a section of the private healthcare sector in South Africa. The database contained more than 2.6 million records for medicines.
- The ATC Classification System², Monthly Index of Medical Specialities (MIMS)³ and the South African Medicines Formulary⁴ were used to classify medicines.
- All products in Anatomical Therapeutic Chemical (ATC) subgroup N02C (antimigraine preparations)² were extracted and analysed. Only the products that were reimbursed by the different medical insurance schemes were included in the study.
- Each medication record contained information on the age and gender of the patient, with a unique number to identify each patient, the date of the prescription, detailed information on the dispensed drug (name, package size, formulation, strength and quantity) and cost.
- Microsoft Access[®] and Excel[®] were used to analyse the data. Descriptive statistics were calculated.
- Limitations included that the study only covered a period of one year. No clinical information or diagnoses were available.
- Ethical approval to conduct studies on electronic databases was obtained from the Research Ethics Committee (Human) of the university (ethics clearance number: H08-HEA-PHA-005).

SHORT RESEARCH REPORT

Consumption of methylphenidate and atomoxetine in the private healthcare sector in South Africa: a longitudinal study

Ashmitha Premchand Munasur-Naidoo¹ · Ilse Truter² 

Received: 16 October 2018 / Accepted: 15 June 2019 / Published online: 16 July 2019

© Springer Nature Switzerland AG 2019

Calculations

- ATC codes:
 - Methylphenidate: N06BA04
 - Atomoxetine: N06B09

- DDDs:
 - Methylphenidate: 30 mg/day
 - Atomoxetine: 80 mg/day

- Number of DDDs/1000 inhabitants/day =
(number of packages dispensed x number of doses (tablets or capsules) per package x number of milligram (mg) per dose 1000 inhabitants)
(DDD in mg x number of inhabitants in South Africa per day)

- Calculated: Number of DDDs/1000 inhabitants/month

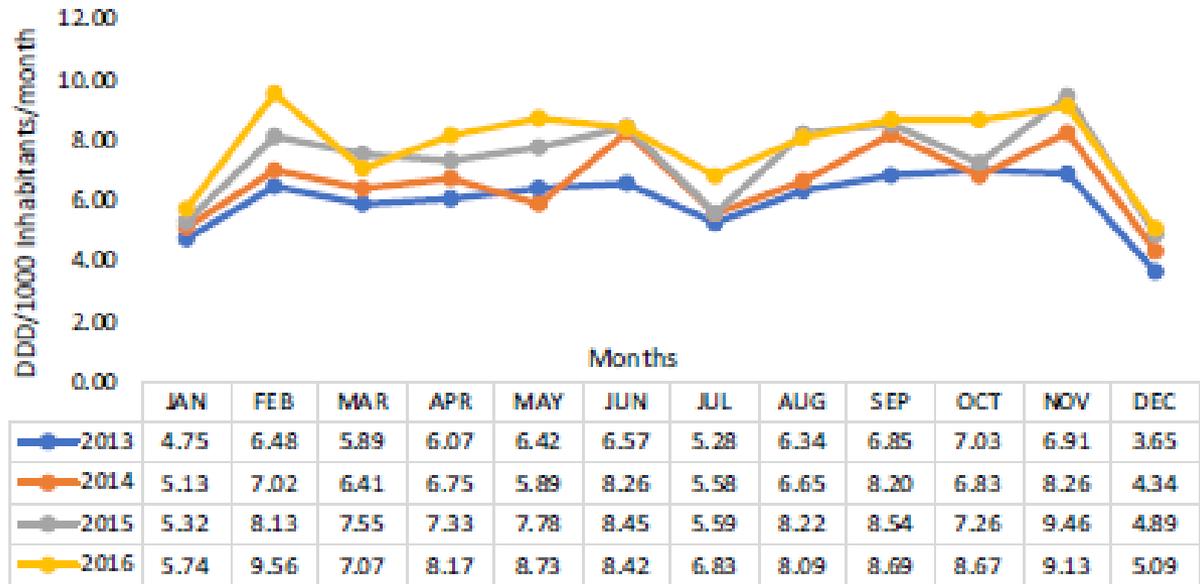

Results

Year	Population of South Africa	Population belonging to the private healthcare sector ^a	DDD/1000 Inhabitants/day (%) (n)	
			MPH	ATX
2013	52,980,000	9,006,600	6.01 (95.85%) n = 827,359	0.26 (4.15%) n = 55,897
2014	54,000,000	9,180,000	6.59 (95.80%) n = 920,920	0.29 (4.20%) n = 61,683
2015	54,960,000	9,343,200	7.36 (96.07%) n = 1,036,293	0.30 (3.93%) n = 65,292
2016	55,910,000	9,504,700	7.83 (96.40%) n = 1,126,558	0.29 (3.60%) n = 57,655

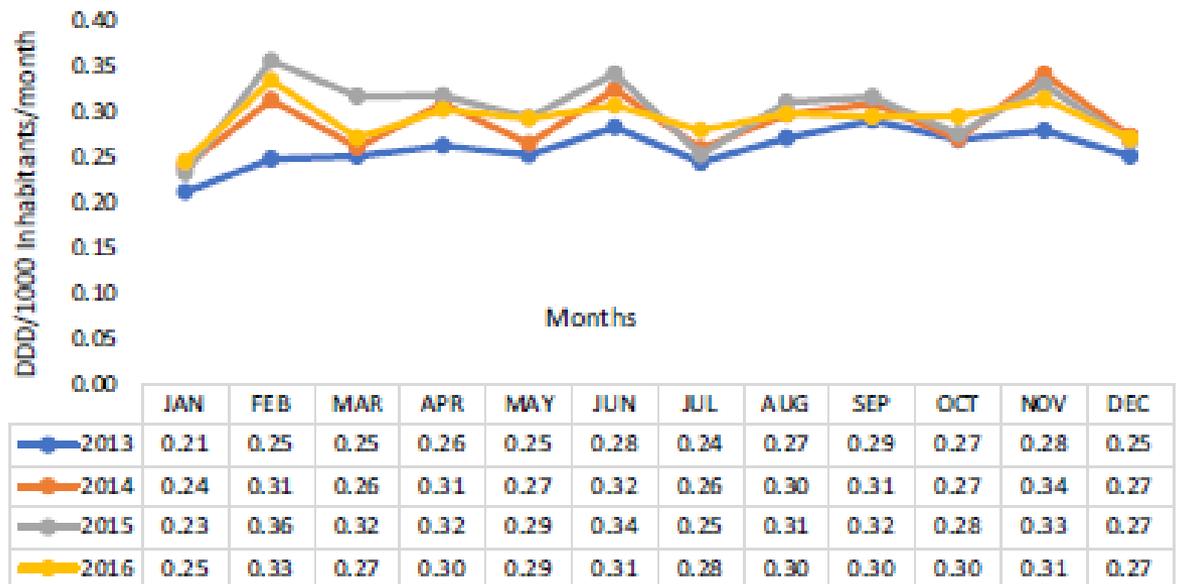

^a17% of the South African population (the estimated population belonging to the private healthcare sector)

Drug consumption expressed as DDDs/1000 inhabitants/month from 2013 to 2016

(a) MPH

(b) ATX

Conclusion

- Clear methodology very important
- Context of the study / local conventions
- Mention year study was conducted
- Comparative studies: Remember possible ATC and/or DDD changes/amendments over time
